# 1 Dataset on Women’s Party-Level Political Representation in Post-Conflict Africa

## 1.1 *Data Collection*

This paper introduces a new dataset on women’s party-level representation in post-conflict Africa. The sample includes all African countries that experienced a rebel group to political party transformation between 1970 and 2020. To identify the sample of countries, I relied on the Uppsala Conflict Data Program (UCDP) Armed Conflict Dataset (ACD) and Zuckerman Daly’s (2021) Civil War Successor Dataset.

I then collected data on the number of candidates fielded and the number of seats received by each party for every post-conflict multi-party election. I collected additional data on the number of women candidates and elected representatives in each election in the sample. This data was collected from a variety of sources, including from the African Democracy Encyclopedia Project of the Electoral Institute of Sustainable Democracy in Africa, the African Election Database, the Inter-parliamentary Union, Parliamentary documents and records, academic sources, and news reports. Much of these sources derive their data from official election records, though some such as news reports or academic scholarship occasionally reported data obtained through interviews or political party press releases.

The dataset does contain some non-random missingness, especially among the candidacy data. Certain countries were generally more difficult to obtain information on, such as Chad, the Republic of Congo, and the Central African Republic. These countries generally were not as well represented within academic work or policy reports. Further, there were fewer archived news reports that could be relied on. There is more widespread missingness for candidacy data. It was difficult to find candidacy data for smaller countries that generally receive less attention from western scholars and news conglomerates, and for elections in dating back to the 1970s, 80s, and occasionally 90s.

Even though the missingness in the candidacy data is not random, the sample should

Figure 1: Missing Data in Candidacy Variable

still be fairly representative, as each include variation in geography, conflict outcome, rebel party seat share, and women’s representation. Further, the non-random missingness is not a product of any of the factors of interest, and instead represents the ease of access to electoral records. Though the missing data poses a difficult problem to the analysis, without evidence that the missing data is related to systematically lower or higher proportions of women candidates, there is not reason to believe it should undermine the finding.

## 2 Effect of Conflict-Specific Contexts

### 2.1 Time

Table 1: Multilevel Linear Regression Model – Time
